

Senior Platform Engineer

Meridian Systems - Remote (US)

About the role

We are hiring a Senior Platform Engineer to own the developer platform that every product team at Meridian ships on. You will design the paved road, not police it.

What you will do

- Own our Kubernetes platform end to end, from cluster upgrades to workload admission policy.
- Build and maintain Terraform modules that product teams consume without reading them.
- Run the CI/CD system, and keep a full build under ten minutes.
- Carry the pager one week in six, and lead blameless incident reviews.

What we are looking for

- 5+ years operating production systems on AWS or GCP.
- Strong Go or Python, and the judgement to know which one a problem wants.
- Deep Kubernetes experience: you have debugged a CNI, not just applied YAML.
- Infrastructure as code as a default, Terraform preferred.
- Observability practice grounded in SLOs, not dashboards for their own sake.

Nice to have

- Experience with eBPF based tooling.
- A track record of reducing cloud spend without hurting reliability.
- Public writing or conference talks about platform work.

Compensation and benefits

\$185,000 - \$225,000 base, plus equity. Remote first within the United States.
